

ARJUN GANESH

Stockholm, Sweden | +46-709668310 | iarjunganesh@gmail.com | arjunganesh.dev | github.com/iarjunganesh | linkedin.com/in/iarjunganesh

PROFESSIONAL SUMMARY

Senior software and AI engineer with 14+ years delivering production systems across regulated banking, media and cloud platforms. Designs and builds systems from discovery and architecture through implementation, deployment and operational support. Current work includes KIRA, a production AI application used daily by Economic Crime Prevention analysts, alongside internal developer tooling and cross-team enablement. Hands-on across Python, Java, TypeScript, APIs, distributed systems, Kubernetes, Azure, AWS and Google Cloud, with applied depth in retrieval, agentic orchestration, evaluation and responsible AI. Won Hack for Good, one of three winners, at the Microsoft Agents League at AI Skills Fest 2026 with ARGUS, and authored a Microsoft Tech Community guest article explaining its architecture.

SKILLS

Solution architecture and technical leadership: Technical discovery, requirements translation, architecture design, rapid prototyping, stakeholder alignment, mentoring and cross-team enablement

Software and distributed systems: Python, FastAPI, Java, Quarkus, TypeScript, React, REST APIs, microservices, asynchronous workflows, event-driven processing and system integration

Applied AI and retrieval: RAG, hybrid and vector search, embeddings, LLM orchestration, multi-agent systems, A2A, MCP, evaluation and human review

Cloud and platform engineering: Azure, AWS, Google Cloud, Kubernetes, Docker, OpenShift, reusable libraries and deployment automation

Engineering productivity and operations: GitHub Actions, CI/CD, observability, structured telemetry, automated testing, performance optimisation and production support

Responsible AI and regulated delivery: Deterministic controls, citation verification, data minimisation, security, privacy, auditability and compliance

PROFESSIONAL HISTORY

SOFTWARE ENGINEER — SWEDBANK, STOCKHOLM | 06/2025 – PRESENT

- Architected and built KIRA, a production AI application used daily by Economic Crime Prevention analysts, translating a regulated investigation workflow into ingestion, retrieval, orchestration and an analyst-facing experience.
- Built Python APIs and LLM workflows combining search with deterministic compliance logic; added GDPR-aware evidence trails so analysts can inspect and review generated findings.
- Worked across business stakeholders and engineering teams to clarify operational needs, resolve technical constraints and shape explainable AI capabilities for production use.
- Built internal developer tools, delivered enablement sessions for engineers across teams and provided ongoing guidance on technical questions and adoption.
- Consolidated distributed services into reusable libraries and standardised authentication (OAuth 2.0/OIDC, JWT), observability and deployment patterns; migrated pipelines to GitHub Actions and sustained 95%+ automated test coverage.

SENIOR JAVA DEVELOPER — VIAPLAY GROUP, STOCKHOLM | 09/2021 – 06/2025

- Delivered Java and Quarkus microservices for a streaming-media platform across AWS and on-premises Kubernetes, owning architecture, implementation, deployment and production operations.
- Architected event-driven rendition pipelines with Camunda and AWS services, creating reusable patterns for asynchronous media processing and platform integration.
- Built Python automation for media metadata extraction and validation; delivered approximately 30% improvement in media-processing throughput and 40% reduction in release lead time through optimisation, caching and CI/CD automation.

SOFTWARE DEVELOPER — EXPLEO TECHNOLOGY NORDIC, GOTHENBURG | 03/2021 – 09/2021

- Delivered domain-driven microservices with strong unit testing and produced technical documentation and workflow diagrams that reduced onboarding time by approximately 50%.

TECHNICAL LEAD — IBM, SYDNEY AND PUNE | 08/2012 – 01/2021

Progressed from Associate System Engineer across banking and digital platform programs.

- Built backend applications and REST APIs for regulated banking programs across distributed teams, covering profile management, validation, enrichment and identity verification integrations.
- Delivered across privacy, AML, customer establishment, customer service and online lending in complex enterprise stakeholder environments.
- Contributed through architecture discussions, code reviews, mentoring, engineering standards and technical documentation.
- Improved response times by approximately 25% through indexing, query tuning and caching; modernised delivery pipelines with Jenkins, Bamboo and Artifactory.

PROJECTS

ARGUS - Agentic KYC Risk Platform | github.com/iarjunganesh/argus

Hack for Good winner, 1 of 3, Microsoft Agents League at AI Skills Fest 2026

- Built a six-service multi-agent KYC system in Python: five specialist agents covering identity, screening, corporate, transaction and compliance fan out in parallel over a versioned agent-to-agent envelope, with compliance fan-in and a task-level audit trace on every report.
- Grounded regulatory and typology retrieval in Azure AI Search indexes defined as code; Azure OpenAI for decision explanations over Cosmos DB entity and transaction data, with deterministic weighted risk scoring and fixed tier thresholds.

BASTION - Governed Agentic Access Review | github.com/iarjunganesh/bastion | **All Things Agentic Hackathon 2026**

- Built a read-only IAM review system on Google Cloud with three Google ADK agents, registry-backed admission, Model Armor screening and deterministic risk detection ahead of the model; no raw IAM binding reaches the model or a notification. 321 tests at 100% statement and branch coverage.

Continuum - Durable Agentic Memory | github.com/iarjunganesh/continuum | **CockroachDB × AWS Hackathon - Build with Agentic Memory 2026**

- Built an incident-response agent on AWS Lambda and CockroachDB combining a structured service filter with semantic ranking in one C-SPANN vector query over Amazon Bedrock Titan embeddings; raised retrieval precision@1 from 55% to 98% by replacing placeholder vectors, and durable checkpoints resumed 50 of 50 interrupted steps, 10 of 10 real SIGKILLS and 15 of 15 AWS-terminated invocations, with no duplicated actions.

DRIFT - Grounded Release Intelligence | github.com/iarjunganesh/drift | **OpenAI Build Week 2026**

- Built a six-stage FastAPI and Next.js/TypeScript pipeline turning noisy release feeds into cited briefings; pinned every claim to a verbatim source excerpt with character offsets and a SHA-256 hash, retrieving over OpenAI embeddings and PostgreSQL/pgvector with a human gate before publication. 189 tests at 100% backend coverage.

PUBLICATIONS

ARGUS: Compliance Infrastructure That Believes Financial Access Is a Human Right | Microsoft Tech Community, July 2026

- Authored a guest article explaining ARGUS's problem framing, multi-agent architecture, grounding strategy, auditability and human-centred roadmap.

CERTIFICATIONS & TRAINING

- **NVIDIA Certified Professional: Agentic AI (NCP-AAI) — NVIDIA**
- Microsoft AI-102: Designing and Implementing a Microsoft Azure AI Solution - instructor-led training completed, March 2026
- Kubernetes Administration (LFS458) — The Linux Foundation
- Machine Learning and AI Foundations: Prediction, Causation, and Statistical Inference — LinkedIn Learning

EDUCATION

- ❖ **Master of Computer Applications — PES Institute of Technology, Bengaluru (2012)**
- ❖ **Bachelor of Science (Computer Science) — NIE College of Science, Mysuru (2009)**
