

ARJUN GANESH

Stockholm, Sweden | +46-709668310 | iarjunganesh@gmail.com | arjunganesh.dev | linkedin.com/in/iarjunganesh

PROFESSIONAL SUMMARY

Senior software engineer with 13+ years building production systems and enabling platforms across banking, media, and AI. Hands-on architect and builder across Python, Java, and cloud-native infrastructure. Proven track record designing reliable, observable platforms that other teams build on—from discovery and technical scoping through implementation, rollout, and operational support.

CORE COMPETENCIES

Platform and infrastructure thinking: Designing systems that enable teams, with developer experience as first-class concern
Production systems architecture: Backend services, APIs, orchestration, observability, testing, release automation, and operational resilience
Full-stack technical delivery: Python, Java (Spring Boot, Quarkus), React—and knowing when to integrate vs. build
AI infrastructure and workflows: RAG, vector search, LLM orchestration, agentic systems, evaluation, and auditability in regulated contexts
Cross-functional collaboration: Discovery, scoping, technical documentation, playbooks, stakeholder alignment, and clear communication of complex systems
Regulated environments: Banking, compliance, and operationally-focused AI deployment with governance-first architecture

TECHNICAL SKILLS

Languages: Python, Java (Spring Boot, Quarkus), Scripting (PowerShell, Bash)
AI and infrastructure: RAG, vector search (Azure AI Search, Elasticsearch), LLM/OCR pipelines, prompt/tool orchestration, semantic kernel, agentic workflows, evaluation frameworks
Platforms & orchestration: Kubernetes, Docker, Podman, OpenShift, Spring Cloud Gateway
Cloud platforms: Azure (AI Search, Functions, Event Grid, Cosmos DB, Blob Storage), AWS (EKS, EC2, S3, SQS/SNS, IAM), GCP (BigQuery)
Observability & monitoring: Application Insights, structured logging, tracing, GitHub Actions, CI/CD pipelines
Datastores: PostgreSQL, MongoDB, Redis, Camunda
ML & experimentation: NVIDIA CUDA benchmarking, PyTorch, TensorFlow, Hugging Face, local model evaluation in regulated contexts

PROFESSIONAL HISTORY

SOFTWARE ENGINEER — SWEDBANK, STOCKHOLM | 06/2025 – PRESENT

- Consolidated distributed services into a multi-module architecture with standardized libraries and deployment patterns suitable for regulated banking environments.
- Centralized routing and cross-cutting concerns (authentication, observability, governance) through Spring Cloud Gateway, enabling teams to integrate with compliance workflows reliably.
- Migrated internal pipelines and libraries from OpenShift-oriented workflows to GitHub and GitHub Actions, reducing deployment overhead and improving developer experience across teams.
- Built robust JUnit 5 test suites and quality gates, sustaining 95%+ test coverage across the unified architecture and establishing standards for downstream teams.
- Integrated observability through Application Insights, enabling operators and developers to troubleshoot issues in production banking systems with confidence.

KIRA - KYC Intelligent Risk Agent (Internal AI Platform Initiative) | Azure AI Foundry

- Architected and built an end-to-end AI platform on Azure for KYC case investigation workflows supporting Economic Crime Prevention scenarios—designed for analyst and operational team use.
 - Designed AI architecture across data ingestion, retrieval, orchestration, and analyst-facing workflows. Built Python orchestration and API layers integrating LLM workflows, deterministic compliance logic, and search patterns.
 - Implemented GDPR-aware auditability and traceability patterns suitable for regulated operational use—enabling analysts to understand AI reasoning and maintain trust in automated workflows.
 - Delivered practical interaction modes (server, CLI, chat-style) and developer-friendly APIs, enabling other teams to extend and operationalize AI-assisted compliance checking.

SENIOR JAVA DEVELOPER — VIAPLAY GROUP, STOCKHOLM | 09/2021 – 06/2025

- Delivered Java/Quarkus microservices across AWS cloud and on-prem Kubernetes, owning full lifecycle from design through production operations. Built infrastructure and services that other teams relied on for media asset lifecycle management.

- Architected event-driven rendition pipelines with Camunda and AWS services, establishing patterns for asynchronous processing and workflow orchestration that became team standards.
- Developed Python automation and operational tooling for media metadata extraction/validation, improving troubleshooting speed and operational efficiency for support teams.
- Improved performance (~30%) and delivery speed (~40%) through optimization, caching, CI/CD automation, and stronger testing practices—demonstrating platform-level impact.

SOFTWARE DEVELOPER — EXPLEO TECHNOLOGY NORDIC, GOTHENBURG | 03/2021 – 09/2021

- Delivered domain-driven microservices with strong unit testing under tight timelines, and produced technical documentation and workflow diagrams that cut onboarding time by ~50%.

IBM — BANKING & DIGITAL PLATFORMS, SYDNEY & PUNE | 08/2012 – 01/2021

Roles: Associate System Engineer → Staff Application Development Analyst → Sr. Software Engineer → Sr. Application Developer

- Built backend applications and APIs for regulated banking programs across onshore/offshore teams. Delivered customer establishment capabilities covering profile management, validations, enrichment, and identity verification integrations.
- Improved performance and stability (~25% response-time gains) through indexing, query tuning, caching, and production-readiness practices—foundational platform-level work.
- Modernized delivery pipelines with Jenkins/Bamboo/Artifactory and governance controls, reducing release effort and deployment failures—establishing infrastructure patterns for teams.

Selected Programs (Client: Westpac Banking Corporation)

- Privacy/AML and Customer Establishment APIs for regulated retrieval/update of sensitive customer data, demographic validation, enrichment, and identity verification orchestration.
- Customer Service Hub and LOLA online lending backend services supporting single customer view, cross-channel servicing, and step-based conversational application flows.

AI/ML WORK & HACKATHON BUILDS

- Built ARGUS (Agentic KYC Risk Platform) solo and won Hack for Good (1 of 3 winners) at the Microsoft Agents League Hackathon 2026 — five specialist AI agents coordinated over the A2A protocol on Azure AI Foundry, with every finding grounded in cited regulation and every decision backed by a full audit trail.
- DRIFT — release intelligence for GPU & AI infrastructure teams; live in production, built for OpenAI Build Week (Devpost).
- Banker's Wrapped — AI-powered financial storytelling; live in production, built for Backblaze Generative Media (Devpost).
- Continuum — durable incident-response memory for agentic systems; execution state persists in CockroachDB so a cold-started agent resumes from the exact interrupted step (in development, CockroachDB AI Devpost).
- q1729 (the quantum taxicab) — Ramanujan's mathematics meets the NVIDIA stack; independent research combining CUDA-Q/cuQuantum simulation with an AI analysis layer.
- Personal infrastructure work: NVIDIA CUDA benchmarking and optimization, PyTorch/TensorFlow local model experimentation, evaluation frameworks for LLM outputs in compliance contexts. Focuses on understanding AI foundations and practical operationalization in regulated environments.

CERTIFICATIONS & TRAINING

Microsoft AI-102 (Designing and Implementing a Microsoft Azure AI Solution) - Instructor-led course completed, March 2026

NVIDIA Certified Professional: Agentic AI (NCP-AAI) — NVIDIA

IBM Machine Learning Essentials — IBM

Python for Data Science — IBM

Machine Learning and AI Foundations: Prediction, Causation, and Statistical Inference — LinkedIn Learning Community

Kubernetes Administration (LFS458) — The Linux Foundation

EDUCATION

Master of Computer Applications — PES Institute of Technology, Bengaluru (2012)

Bachelor of Science (Computer Science) — NIE College of Science, Mysuru (2009)
